

PRESS RELEASE

Paris, 20 July 2020 – **WS HSM**: a security solution for all public transport players.

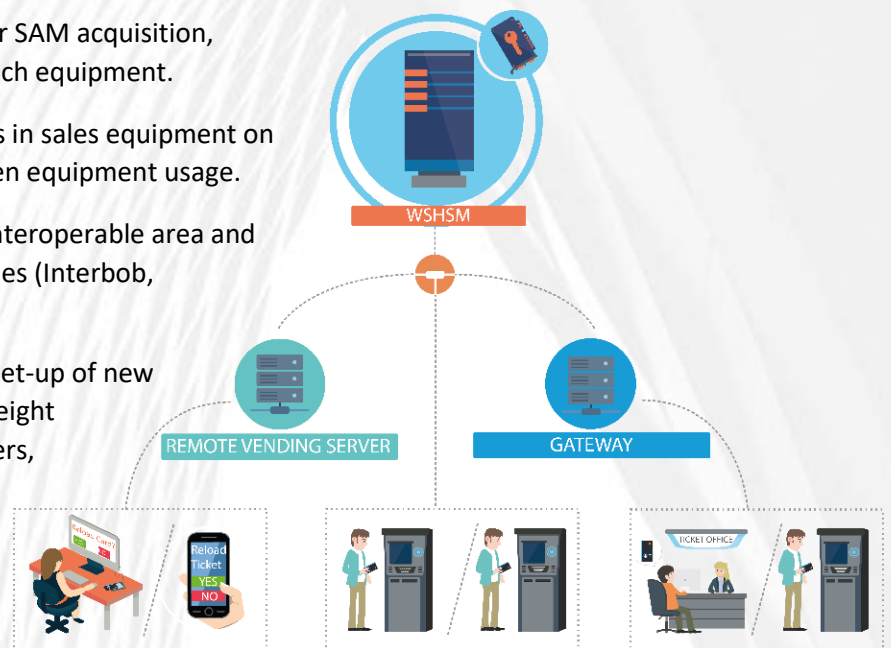

After successfully implementing the WS HSM in many transit networks, Spiritech now proposes this innovative solution as SaaS in order to facilitate the expansion of new distribution channels.

The **WS HSM** secures transactions between public transport cards and vending machines - TVM, sales booth, remote vending server, smartphone – without requiring a SAM in each equipment: the vending machine simply connects to the WS HSM to secure the transactions.

The **WS HSM** is a time proven solution, now available as a service (SaaS).

Advantages of the WS HSM:

- **Cost reduction:** eliminate costs for SAM acquisition, monitoring and replacement in each equipment.
- **Improved security:** no more SAMs in sales equipment on site, thus avoiding any risk of stolen equipment usage.
- **Interoperability:** usable over an interoperable area and compliant with all ticketing schemes (Interbob, Intercode, etc.).
- **New distribution channels:** easy set-up of new distribution channels with light-weight terminals (Android phones, resellers, remote vending, etc.).
- **Data Independence:** between different operators and integrators of an interoperable region.
- **Simple and flexible integration:** a reactive team of experts at your service to help you integrate the service.
- **Ethical solution:** GDPR compliant and respectful of privacy.
- **Ease of implementation:** service delivered preconfigured, with our assistance for integration.

Spiritech is an independent engineering company with international experts in the fields of **public transport ticketing, cryptography and contactless technology.**
